PRODUCT DATASHEET PEI676SER

PEI676SER

(600233)

The TETRA PEI-interface PEI676 is connected to the SUB-D socket of WTC676 [600076] and establishes a connection between an inserted MTP850 and the LARDIS system. The LARDIS system simplifies everyday life, by simple group changes of the radio, status handling and radio subscriptions (more information at Lardis.de). Through the interface to the WTC676 you can use all these functions directly in your car. To do this, the PEI adapter is connected to the WTC676 and connected to the LARDIS display with the connection cable. As soon as your MTP850 is inserted into the Car kit, it is automatically recognized.

Connections: SUB-D
